

Finding ways to prevent Liver Cancer

18%

The percentage of people who will survive more than 5 years after being diagnosed with liver cancer.

Most liver cancers occur in people who have liver cirrhosis and end-stage liver disease. These conditions require a liver transplant for cure.

What we
Know

There are currently no preventive medications for liver cancer, but research suggests that use of a green tea extract, Polyphenon E, may reduce the changes in the liver that lead to cancer.

Our Study

Our study will use different doses of Polyphenon E[®] in people with liver cirrhosis, to see whether this green tea extract can decrease the changes of cancer risk in the liver.

You may be compensated up to \$1200 for your participation, your time and extra expenses (child care, travel, absence from work, etc).
